Praktikum Jaringan Komputer

Vlan-Trunk-OSPF-MultiVendor

Atika Najwa Azzahra - 5024241091

2026

1 Langkah-Langkah Percobaan

Praktikum 1 Konfigurasi Cisco Switch

1. Masuk ke Terminal Cisco Switch

```
1 Switch> enable
2 Switch# configure terminal
3 Switch(config)#
```

2. Membuat VLAN

```
1 vlan 10
2   name Finance
3 exit
4
5 vlan 20
6   name HR
7 exit
8
9 vlan 30
10  name IT
11 exit
12
13 vlan 40
14  name Marketingg
15 exit
```

Verifikasi:

```
1 show vlan brief
```

3. Pastikan VLAN Sudah Dibuat dan Statusnya Aktif

Hasil VLAN.

Gambar 1: Show VLAN brief

4. Konfigurasi Access Port untuk Setiap VLAN

Port Access harus disesuaikan dengan interface pada Cisco Switch.

```
1 Switch#conf t
2
3 interface gi0/2
4   description PC-FINANCE-VLAN10
5   switchport mode access
6   switchport access vlan 10
7   no shutdown
8 exit
9
10 interface gi0/1
11   description PC-HR-VLAN20
12   switchport mode access
13   switchport access vlan 20
14   no shutdown
15 exit
16
17 interface gi1/1
18   description PC-IT-VLAN30
19   switchport mode access
20   switchport access vlan 30
21   no shutdown
22 exit
23
24 interface gi0/3
25   description PC-MARKETING-VLAN40
26   switchport mode access
27   switchport access vlan 40
28   no shutdown
29 exit
```

5. Konfigurasi Trunk ke Cisco Router

Konfigurasi trunk port dari switch menuju Cisco Router untuk VLAN 10, 20, 30, dan 40.

Interface Switch	Terhubung ke	Mode	VLAN yang Dibawa
Gi0/0	Cisco Router Gi0/2	Trunk	10,20,30,40

Konfigurasi:

```
1 Switch#conf t
2
3 interface gi0/0
4   switchport trunk encapsulation dot1q
5   description TRUNK-TO-CISCO-ROUTER
6   switchport mode trunk
7   switchport trunk allowed vlan 10,20,30,40
8   no shutdown
9 exit
```

Verifikasi:

```
1 show interfaces trunk
```

Gambar 2: show interfaces trunk

Save semua konfigurasi:

```
1 write memory
```

Praktikum 2 Konfigurasi Cisco Router

1. Masuk ke Cisco Router

```
1 enable
2 configure terminal
```

2. Konfigurasi Interface Trunk ke Switch

Pilih interface yang terhubung ke Cisco Switch. Pada topologi, interface yang terhubung adalah Gig0/2.

```
1 interface gig0/2
2 description TRUNK-T0-CISCO-SWITCH
3 no ip address
4 no shutdown
5 exit
```

3. Konfigurasi Subinterface VLAN 10

```
1 interface gig0/2.10
2 description GATEWAY-VLAN10-FINANCE
3 encapsulation dot1Q 10
4 ip address 192.168.10.1 255.255.255.0
5 no shutdown
6 exit
```

4. Konfigurasi Subinterface VLAN 20

```
1 interface gig0/2.20
2   description GATEWAY-VLAN20-HR
3   encapsulation dot1Q 20
4   ip address 192.168.20.1 255.255.255.0
5   no shutdown
6   exit
```

5. Konfigurasi Subinterface VLAN 30

```
1 interface gig0/2.30
2   description GATEWAY-VLAN30-IT
3   encapsulation dot1Q 30
4   ip address 192.168.30.1 255.255.255.0
5   no shutdown
6   exit
```

6. Konfigurasi Subinterface VLAN 40

```
1 interface gig0/2.40
2   description GATEWAY-VLAN40-MARKETING
3   encapsulation dot1Q 40
4   ip address 192.168.40.1 255.255.255.0
5   no shutdown
6   exit
```

7. Konfigurasi DHCP-Server untuk VLAN 10

```
1 ip dhcp excluded-address 192.168.10.1 192.168.10.10
2
3 ip dhcp pool VLAN10-FINANCE
4   network 192.168.10.0 255.255.255.0
5   default-router 192.168.10.1
6   dns-server 8.8.8.8
7 exit
```

8. Konfigurasi DHCP-Server untuk VLAN 20

```
1 ip dhcp excluded-address 192.168.20.1 192.168.20.10
2
3 ip dhcp pool VLAN20-HR
4   network 192.168.20.0 255.255.255.0
5   default-router 192.168.20.1
6   dns-server 8.8.8.8
7 exit
```

9. Konfigurasi IP Static pada VPCS untuk VLAN 30 dan 40

PC VLAN 30:

```
1 ip 192.168.30.10/24 192.168.30.1
```

PC VLAN 40:

```
1 ip 192.168.40.10/24 192.168.40.1
```

PC VLAN 10 dan 20 menggunakan DHCP:

```
1 ip dhcp
```

10. Verifikasi Cisco Router

Cek interface:

```
1 show ip interface brief
```

Gambar 3: Show IP interface brief

Cek DHCP Pool:

```
1 show ip dhcp pool
```

Gambar 4: Show ip dhcp pool

Cek client DHCP yang mendapatkan IP:

```
1 show ip dhcp binding
```

Gambar 5: Show ip dhcp binding

11. Pengujian dari VPCS

Masuk ke PC VLAN 10 untuk request IP secara DHCP:

```

1 ip dhcp
2 show ip

```

Gambar 6: request ip dhcp

Ping gateway VLAN 10:

```

1 ping 192.168.10.1

```

Gambar 7: ping gateway VLAN 10

Masuk ke PC VLAN 20 untuk request IP secara DHCP:

Gambar 8: request ip dhcp

```
1 ip dhcp
2 show ip
```

Ping gateway VLAN 20:

```
1 ping 192.168.20.1
```

Gambar 9: ping gateway VLAN 20

Ping gateway VLAN 30:

```
1 ping 192.168.30.1
```

Gambar 10: ping gateway vlan 30

Ping gateway VLAN 40:

```
1 ping 192.168.40.1
```

Gambar 11: ping gateway vlan 40

Uji ping antar VLAN dari VLAN 10:

```
1 ping 192.168.20.11  
2 ping 192.168.30.10  
3 ping 192.168.40.10
```

Gambar 12: dari vlan 10

Lihat DHCP Binding:

```
1 show ip dhcp binding
```

Gambar 13: ip dhcp binding

Amati IP yang diberikan oleh router ke client sesuai dengan IP pada PC VLAN 10 dan VLAN 20.

12. Hasil yang Diharapkan

- Cisco Router memiliki subinterface VLAN 10, 20, 30, dan 40.
- VLAN 10 mendapat gateway 192.168.10.1.
- VLAN 20 mendapat gateway 192.168.20.1.
- VLAN 30 mendapat gateway 192.168.30.1.
- VLAN 40 mendapat gateway 192.168.40.1.
- PC VLAN 10 dan VLAN 20 mendapatkan IP dari DHCP.
- Semua PC dapat ping gateway masing-masing.
- PC antar-VLAN dapat saling ping melalui Cisco Router.

Praktikum 3 Konfigurasi Huawei Router dan IP Address Antar Router

1. Konfigurasi LAN Huawei

Konfigurasi IP Address untuk LAN Huawei:

```
1 system-view
2
3 interface Ethernet1/0/2
4   description LAN-HUAWEI
5   ip address 192.168.50.1 255.255.255.0
6   undo shutdown
7   quit
8
9 commit
```

Gambar 14

2. Konfigurasi IP VPC LAN Huawei

Pada PC LAN Huawei:

```
1 ip 192.168.50.10/24 192.168.50.1
```

Verifikasi:

```
1 show ip
```

Gambar 15

Testing ping gateway Huawei:

```
1 ping 192.168.50.1
```

Pastikan hasilnya reply.

Target:

PC LAN Huawei dapat melakukan ping ke gateway 192.168.50.1.

Gambar 16

3. Konfigurasi IP Link Cisco Huawei Link 1

Network:

```
1 10.10.10.0/30
```

Perangkat	Interface	IP Address
Cisco Router	Gi0/3	10.10.10.1/30
Huawei Router	Ethernet1/0/0	10.10.10.2/30

Cisco Router:

```
1 enable
2 configure terminal
3
4 interface gi0/3
```

```

5 description LINK1-T0-HUAWEI
6 ip address 10.10.10.1 255.255.255.252
7 no shutdown
8 exit

```

Huawei Router:

```

1 system-view
2
3 interface Ethernet1/0/0
4 description LINK1-T0-CISCO
5 ip address 10.10.10.2 255.255.255.252
6 undo shutdown
7 quit
8
9 commit

```

Gambar 17

1.1 4. Konfigurasi IP Link Cisco Huawei Link 2

Network:

```

1 10.10.11.0/30

```

Perangkat	Interface	IP Address
Cisco Router	Gi0/0	10.10.11.1/30
Huawei Router	Ethernet1/0/4	10.10.11.2/30

Cisco Router:

```

1 interface gi0/0
2 description LINK2-T0-HUAWEI
3 ip address 10.10.11.1 255.255.255.252
4 no shutdown
5 exit

```

```

Praktikum 4 Konfigurasi OSPF Multivendor dan OSPF Cost

1. Konsep Routing OSPF pada Topologi

Pada topologi ini, Cisco Router dan Huawei memiliki 2 jalur utama. Lalu, Mikrotik digunakan sebagai jalur cadangan jika 2 link utama tidak berfungsi.

Link	Cost	Fungsi
Cisco - Huawei Link 1	10	Jalur utama
Cisco - Huawei Link 2	10	Jalur utama
Cisco - MikroTik	100	Jalur backup
Huawei - MikroTik	100	Jalur backup

2. Network yang Diiklankan ke OSPF

Cisco Router

Network	Keterangan
10.10.10.0/30	Link Cisco-Huawei 1
10.10.11.0/30	Link Cisco-Huawei 2
10.10.30.0/30	Link Cisco-MikroTik
192.168.10.0/24	VLAN 10 Finance
192.168.20.0/24	VLAN 20 HR
192.168.30.0/24	VLAN 30 IT
192.168.40.0/24	VLAN 40 Marketing

Huawei Router

Network	Keterangan
10.10.10.0/30	Link Huawei-Cisco 1
10.10.11.0/30	Link Huawei-Cisco 2
10.10.20.0/30	Link Huawei-MikroTik
192.168.50.0/24	LAN Huawei

MikroTik

Network	Keterangan
10.10.20.0/30	Link MikroTik-Huawei
10.10.30.0/30	Link MikroTik-Cisco

3. Konfigurasi OSPF pada Cisco Router

Masuk ke Cisco Router:

```
1 enable
2 configure terminal
```

Konfigurasi OSPF:

```
1 router ospf 1
2   router-id 1.1.1.1
3   network 10.10.10.0 0.0.0.3 area 0
```

```

4 network 10.10.11.0 0.0.0.3 area 0
5 network 10.10.30.0 0.0.0.3 area 0
6 network 192.168.10.0 0.0.0.255 area 0
7 network 192.168.20.0 0.0.0.255 area 0
8 network 192.168.30.0 0.0.0.255 area 0
9 network 192.168.40.0 0.0.0.255 area 0
10 exit

```

Atur OSPF Cost:

```

1 interface gi0/3
2   description LINK1-T0-HUAWEI
3   ip ospf cost 10
4 exit
5
6 interface gi0/0
7   description LINK2-T0-HUAWEI
8   ip ospf cost 10
9 exit
10
11 interface gi0/1
12   description LINK-T0-MIKROTIK
13   ip ospf cost 100
14 exit

```

Verifikasi:

```

1 show ip ospf neighbor
2 show ip route ospf
3 show ip protocols

```

```

1.5 3. Kondisi Dua Link Cisco-Huawei Mati

Matikan link Cisco-Huawei yang kedua:

```
1 configure terminal
2 interface gi0/0
3 shutdown
4 exit
```

Cek route dari Cisco menuju LAN Huawei:

```
1 show ip route 192.168.50.0
```

Lakukan trace dari PC VLAN menuju LAN Huawei:

```
1 trace 192.168.50.10
```

Hasil yang diharapkan:

Route berpindah ke jalur backup melalui MikroTik.

Jalur:

PC VLAN → Cisco Router → MikroTik → Huawei Router → LAN Huawei

4. Mengaktifkan Kembali Dua Link Cisco-Huawei

```
1 configure terminal
2 interface gi0/3
3   no shutdown
4 exit
5
6 interface gi0/0
7   no shutdown
8 exit
```

Cek route dari Cisco menuju LAN Huawei:

```
1 show ip route 192.168.50.0
```

Lakukan trace dari PC VLAN menuju LAN Huawei:

```
1 trace 192.168.50.10
```

Gambar 47

Hasil yang diharapkan:

Jalur routing kembali pindah ke link utama Cisco-Huawei.

2 Analisis Hasil Percobaan

Pada praktikum ini dilakukan konfigurasi jaringan secara bertahap mulai dari pembuatan VLAN pada Cisco Switch, konfigurasi router sebagai gateway setiap VLAN, konfigurasi IP antar router, implemen-

tasi routing OSPF multivendor, hingga pengujian failover OSPF. Secara umum seluruh konfigurasi berhasil dilakukan sesuai dengan tujuan praktikum.

Pada Praktikum 1, VLAN 10, 20, 30, dan 40 berhasil dibuat pada Cisco Switch serta masing-masing port berhasil dikonfigurasi sebagai access port sesuai VLAN yang digunakan. Selain itu, trunk port yang menghubungkan switch dengan Cisco Router juga berhasil membawa seluruh VLAN yang diperlukan. Hal ini dibuktikan dari hasil verifikasi VLAN dan trunk yang menunjukkan konfigurasi sudah berjalan dengan baik.

Pada Praktikum 2, Cisco Router berhasil dikonfigurasi sehingga dapat menjadi gateway bagi seluruh VLAN. DHCP Server yang dibuat pada VLAN 10 dan VLAN 20 juga berhasil memberikan alamat IP secara otomatis kepada client. Sementara itu, VLAN 30 dan VLAN 40 yang menggunakan IP statis juga dapat terhubung dengan baik. Hasil pengujian menunjukkan bahwa perangkat yang berada pada VLAN yang berbeda dapat saling berkomunikasi, sehingga inter-VLAN routing berhasil diterapkan.

Pada Praktikum 3 dilakukan konfigurasi alamat IP pada setiap link yang menghubungkan Cisco Router, Huawei Router, dan MikroTik. Selain itu, jaringan LAN pada sisi Huawei juga berhasil dikonfigurasi. Berdasarkan hasil pengujian ping antar router, seluruh perangkat dapat saling terhubung tanpa kendala. Hal ini menunjukkan bahwa konfigurasi addressing yang dilakukan sudah sesuai dan seluruh interface yang digunakan berada dalam kondisi aktif.

Selanjutnya pada Praktikum 4 dilakukan implementasi routing dinamis menggunakan OSPF pada Cisco Router, Huawei Router, dan MikroTik. Setelah konfigurasi selesai, seluruh router berhasil membentuk neighbor OSPF dan bertukar informasi routing. Routing table pada masing-masing router juga sudah berisi network yang berasal dari router lain sehingga komunikasi antar jaringan dapat dilakukan secara otomatis. Saat pengujian konektivitas, hampir seluruh pengujian berhasil dilakukan. Namun sempat terjadi timeout ketika PC LAN Huawei melakukan ping ke alamat 192.168.10.11. Setelah dilakukan pengecekan kembali, tidak ditemukan masalah pada konfigurasi OSPF maupun routing table. Kemungkinan hal tersebut terjadi karena proses konvergensi jaringan atau keterlambatan host dalam merespons paket pertama. Selain pengujian tersebut, komunikasi antar jaringan dapat berjalan dengan normal.

Pada Praktikum 5 dilakukan pengujian failover OSPF dengan mematikan link utama antara Cisco Router dan Huawei Router. Hasil pengujian menunjukkan bahwa ketika satu link utama dimatikan, jaringan tetap dapat berkomunikasi menggunakan link utama lainnya. Ketika kedua link utama dimatikan, jalur komunikasi berpindah melalui MikroTik sebagai jalur cadangan. Setelah kedua link diaktifkan kembali, jalur routing kembali menggunakan link utama. Hasil ini menunjukkan bahwa mekanisme failover OSPF berjalan sesuai dengan yang diharapkan. Akan tetapi, dokumentasi pada praktikum ini kurang lengkap karena tidak semua screenshot trace berhasil dikumpulkan sesuai petunjuk modul.

3 Hasil Tugas Modul

Gambar 48: Readme

4 Kesimpulan

Berdasarkan seluruh praktikum yang telah dilakukan, dapat disimpulkan bahwa konfigurasi jaringan menggunakan Cisco Switch, Cisco Router, Huawei Router, dan MikroTik berhasil diterapkan sesuai dengan tujuan yang telah ditentukan. VLAN berhasil dibuat dan dikonfigurasi pada Cisco Switch, kemudian inter-VLAN routing menggunakan metode Router-on-a-Stick pada Cisco Router juga dapat berjalan dengan baik sehingga perangkat yang berada pada VLAN yang berbeda dapat saling berkomunikasi.

Selain itu, konfigurasi alamat IP antar router berhasil dilakukan sehingga seluruh perangkat dapat saling terhubung. Implementasi routing dinamis menggunakan OSPF pada perangkat multivendor juga berhasil membentuk neighbor dan bertukar informasi routing secara otomatis. Hal ini memungkinkan seluruh jaringan dapat saling berkomunikasi tanpa perlu menambahkan route secara manual.

Pengujian failover OSPF menunjukkan bahwa ketika jalur utama mengalami gangguan, OSPF dapat secara otomatis memilih jalur alternatif sehingga konektivitas jaringan tetap terjaga. Meskipun sempat terjadi timeout pada salah satu pengujian ping dari PC LAN Huawei ke alamat 192.168.10.11 serta dokumentasi screenshot pada Praktikum 5 belum sepenuhnya lengkap, secara keseluruhan fungsi jaringan tetap berjalan dengan baik dan seluruh tujuan praktikum berhasil dicapai.

Melalui praktikum ini, praktikan memperoleh pemahaman mengenai konfigurasi VLAN, inter-VLAN routing, konfigurasi IP addressing antar router, implementasi routing dinamis OSPF multivendor, serta mekanisme failover yang digunakan untuk meningkatkan keandalan dan ketersediaan jaringan.
